Attached Report from [REDACTED] A

1. Attached herewith is an informal report made on a recent conference by [REDACTED] with [REDACTED] a cleared contact of this branch. C

2. [REDACTED], who is a personal friend of [REDACTED] is a Ph.D. (Chemistry) and, in addition, according to [REDACTED] an outstanding medical doctor. [REDACTED] further describes [REDACTED] as being very patriotically motivated with a great curiosity and wide contacts in fields of interest to us. A

3. [REDACTED]'s report is strictly informal and merely touches the high points of the discussions along ARTICHOKE lines. The copy attached, which I am certain you will find interesting, is for your information and should not be treated as a completely official report. A

Office Memorandum • UNITED STATES GOVERNMENT

TO : Chief, Technical Branch

DATE: 1 October 1953

FROM : [REDACTED] A

SUBJECT: Conferences with [REDACTED] 21-22 September 1953. C

Mescaline

C [REDACTED] does not believe that schizophrenia is produced by an endogenous "M-substance" reflecting or complicating the body's adrenalin (as postulated in Humphrey Osmond's "Thoughts on Military Psychiatry" -- author and subject of this report were not named to [REDACTED] since:

1. Mescaline delirium does not approach schizophrenia's ideational character; and
2. Mescaline hallucinations are predominantly visual, schizophrenia's auditory.

However, a schizoid subject's response to the mescaline delirium is schizophrenic.

LSD-25

C [REDACTED] enthusiastically initiated its discussion. He had translated for [REDACTED]

H-B/3 W.A. Stoll, Lysergure-diethylamid, Schweitzer Archiv fur Neurol. u. Psychiatrie, volume 90, pages not given (reprint was repaged), 1947.

This paper, he says, proposed the idea of endogenous production of an LSD-like toxin by schizophrenics.

H-B/6 His contact with [REDACTED] is [REDACTED]. He anticipates seeing their [REDACTED] also, expected to be in this country

[REDACTED]

three more months. He has already been given a quantity of dry LSD-25; has not yet run a systematic experiment with it.

He remarked that this substance "changed the significance of a universal" aspects logic.

Isoclostinic Acid Hydrate.

C [REDACTED] conducted a clinical study of this [REDACTED] patients. Its psychic effects were minimal in the doses used.

Amphetamines, etc.

[REDACTED] was [REDACTED] already noted, that useful substances variably related to the four above, could and should be synthesized by "blocking" at different points on the ring.

Anxiety-Reducing Drugs

Chliron, like Derivon (practically odorless and tasteless), produces normal sleep; less dangerous than chloral hydrate. Chliron reduces anxiety, without sleep, in smaller doses.

Kyanesin (cyclohexin) does not reduce anxiety significantly in his experience.

Dibenzamine may reduce anxiety, but sometimes fatal.

X₂

30-100, Medusa method; slow coma. 100, 1 or 2 branches; immediate coma, but sometimes fatal. No drug antitoxin known.

c

He suggested that, if non-toxic doses of $\alpha\alpha'$ would make the brain fluoresce, then experiments on artificial-salivarium monkeys might show concentrations in latent regions, and a strong light might have effects on the subject.

C

~~XXXXXX~~ and ~~XXXXXX~~ successfully used Isolation Technique in attempting to provide some fairly re-evaluated substance in psychiatric, where the brain was successfully intimidated and unable to use glucose. Demand and claimed ~~XXXXXX~~ tried too little -- 4 instead of 100 grams in 2- hours. ~~XXXXXX~~ claims the subjects could not have tolerated such a load of sugar. His reversal sounds valid to me, and this experiment was conducted under no supervision, several years ago. So far as it goes, it seems to make Garrod's credibility.
